32 mg tablets: White to off white film coated, round, biconvex tablets printed with "269" with black ink on one side of

Opioid non-tolerant patients. Fatal respiratory depression could occur in patients who are not opioid tolerant.

Acute or severe bronchial asthma in an unmonitored setting or in the absence of resuscitative equipment [see

Known or suspected gastrointestinal obstruction, including paralytic ileus [see Warnings and Precautions (5.11)].

Patients who have had surgical procedures and/or underlying disease resulting in narrowing of the gastrointestinal tract, or have "blind loops" of the gastrointestinal tract or gastrointestinal obstruction [see Warnings and

Patients with hypersensitivity (e.g., anaphylaxis) to hydromorphone [see Warnings and Precautions (5.14)].

Hydromorphone hydrochloride extended-release tablets contains hydromorphone, a Schedule II controlled substance

As an opioid, hydromorphone hydrochloride extended-release tablets exposes users to the risks of addiction abuse, and misuse [see Drug Abuse and Dependence [9]]. As modified-release products such as hydromorphone

hydrochloride extended-release tablets deliver the opioid over an extended period of time, there is a greater risk for

overdose and death due to the larger amount of hydromorphone present.

Although the risk of addiction in any individual is unknown, it can occur in patients appropriately prescribed

hydromorphone hydrochloride extended-release tablets and in those who obtain the drug illicitly. Addiction can occur

Assess each patient's risk for opioid addiction, abuse, or misuse prior to prescribing hydromorphone hydrochloride

extended-release tablets, and reassess all patients receiving hydromorphone hydrochloride extended-release tablets for the development of these behaviors and conditions. Risks are increased in patients with a personal or family history of substance abuse (including drug or alcohol addiction or abuse) or mental illness (e.g., major depression).

The potential for these risks should not, however, prevent the prescribing of hydromorphone hydrochloride extended

release tablets for the proper management of pain in any given patient. Patients at increased risk may be prescribed

terease causes for the proper intelligenter of painting any given patient, readents at incleased that may be prescribed, opioids such as hydromorphone hydrochloride extended-release tablets, but use in such patients necessitates intensive counseling about the risks and proper use of hydromorphone hydrochloride extended-release tablets along

with frequent reevaluation for signs of addiction, abuse, and misuse. Consider prescribing naloxone for the emergency

Abuse or misuse of hydromorphone hydrochloride extended-release tablets by crushing, chewing, snorting, or injecting

the dissolved product will result in the uncontrolled delivery of hydromorphone and can result in overdose and death

Opioids are sought for nonmedical use and are subject to diversion from legitimate prescribed use. Consider

these risks when prescribing or dispensing hydromorphone hydrochloride extended-release tablets. Strategies to reduce these risks include prescribing the drug in the smallest appropriate quantity and advising the patient on careful storage of the drug during the course of treatment and proper disposal of unused drug. Contact local state professional licensing board or state-controlled substances authority for information on how to prevent and detect

Serious, life-threatening, or fatal respiratory depression has been reported with the use of modified-release opioids

even when used as recommended. Respiratory depression from opioid use, if not immediately recognized and treated, may lead to respiratory arrest and death. Management of respiratory depression may include close observation, supportive measures, and use of opioid antagonists, depending on the patient's clinical status [see Overdosage (10)].

Carbon dioxide (CO₂) retention from opioid-induced respiratory depression can exacerbate the sedating effects of While serious, life-threatening, or fatal respiratory depression can occur at any time during the use of hydromorphone hydrochloride extended-release tablets, the risk is greatest during the initiation of therapy or following a dosage

To reduce the risk of respiratory depression, proper dosing and titration of hydromorphone hydrochloride extended release tablets are essential *[see Dosage and Administration (2)]*. Overestimating the hydromorphone hydrochloride

extended-release tablets dose when converting patients from another opioid product can result in fatal overdose with

Accidental ingestion of even one dose of hydromorphone hydrochloride extended-release tablets, especially by

Acculation in gestion of even interests and caregivers on how to recognize respiratory depression and death due to an overdose of hydromorphone.

Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling

911 or getting emergency medical help right away in the event of a known or suspected overdose [see Patient Counseling Information (17)].

Opioids can cause sleep-related breathing disorders including central sleep apnea (CSA) and sleep-related

hypoxemia. Opioid use increases the risk of CSA in a dose-dependent fashion. In patients who present with CSA, consider decreasing the opioid dosage using best practices for opioid taper [see Dosage and Administration (2.5)].

Patient Access to Naloxone for the Emergency Treatment of Opioid Overdose
Discuss the availability of naloxone for the emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing treatment with hydromorphone

Inform patients and caregivers about the various ways to obtain naloxone as permitted by individual state naloxone

dispensing and prescribing requirements or guidelines (e.g., by prescription, directly from a pharmacist, or as part of a community-based program). Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help, even if naloxone is administered [see Patient Counseling Information (17)].

Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS

depressants, a history of polioid use disorder, or prior opioid overdose. The presence of risk factors for overdose should not prevent the proper management of pain in any given patient. Also consider prescribing naloxone if the patien

has household members (including children) or other close contacts at risk for accidental ingestion or overdose.

naloxone is prescribed, educate patients and caregivers on how to treat with naloxone. [see Warnings and Precautions (5.1, 5.3, Patient Counseling Information (17); Overdosage (10)].

another education program that includes all the elements of the FDA Education Blueprint for Health Care Prov Involved in the Management or Support of Patients with Pain.

Discuss the safe use, serious risks, and proper storage and disposal of opioid analgesics with patients and/or their

Emphasize to patients and their caregivers the importance of reading the Medication Guide that they will receive

Consider using other tools to improve patient, household, and community safety, such as patient-prescriber

obtain further information on the opioid analgesic REMS and for a list of accredited REMS CME/CE, call

1-800-503-0784, or log on to www.opioidanalgesicrems.com. The FDA Blueprint can be found at www.fda.gov/

Opioid-Induced Hyperalgesia (OIH) occurs when an opioid analgesic paradoxically causes an increase in pain, or an increase in sensitivity to pain. This condition differs from tolerance, which is the need for increasing doses of opioids

to maintain a defined effect [see Dependence (9.3)]. Symptoms of OIH include (but may not be limited to) increased

levels of pain upon opioid dosage increase, decreased levels of pain upon opioid dosage decrease, or pain from ordinarily non-painful stimuli (allodynia). These symptoms may suggest Oll only if there is no evidence of underlying disease progression, opioid tolerance, opioid withdrawal, or addictive behavior.

Cases of OIH have been reported, both with short-term and longer-term use of opioid analogsics. Though the

caregivers every time these medicines are prescribed. The Patient Counseling Guide (PCG) can be obtained at this

5.3 Risks from Concomitant Use with Benzodiazepines or Other CNS Depressants

treatment of opioid overdose [see Dosage and Administration (2.2), Warnings and Precautions (5.2)].

dosing interval in patients with severe renal impairment [see Use in Specific Populations (8.7)].

Extended-release tablets: available in 8 mg, 12 mg, 16 mg or 32 mg dosage strengths

Hydromorphone hydrochloride extended-release tablets are contraindicated in:

Patients with significant respiratory depression [see Warnings and Precautions (5.2)].

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use HYDROMORPHONE HYDROCHLORIDE EXTENDED-RELEASE TABLETS safely and effectively. See full prescribing information for HYDROMORPHONE HYDROGHLORIDE EXTENDED BY HYDROCHLORIDE EXTENDED-RELEASE TABLETS

HYDROMORPHONE HYDROCHLORIDE extended-release tablets, for oral use, CII

WARNING: SERIOUS AND LIFE-THREATENING RISKS FROM USE OF HYDROMORPHONE HYDROCHLORIDE

EXTENDED-RELEASE TABLETS

See full prescribing information for complete boxed warning.
one hydrochloride extended-release tablets exposes users to risks of addiction, abuse

and misuse, which can lead to overdose and death. Assess patient's risk before prescribing, and monitor regularly for these behaviors and conditions. (5.1) Serious, life-threatening, or fatal respiratory depression may occur. Monitor closely, especially upon initiation or following a dose increase. Instruct patients to swallow hydromorphone hydrochloride

initiation or following a lose increase. Instruct patients to swallow hydromorphone hydrochloride extended-release tablets whole to avoid exposure to a potentially fatal dose of hydromorphone. (5.2) Accidental ingestion of hydromorphone hydrochloride extended-release tablets, especially by children, can result in fatal overdose of hydromorphone. (5.2) Concomitant use of opioids with benzodiazepines or other central nervous system (CNS) depressants, including alcohol, may result in profound sedation, respiratory depression, coma, and death. Reserve concomitant prescribing for use in patients for whom alternative treatment options are inadequate; limit dosages and durations to the minimum required; and follow patients for signs and symptoms of respiratory depression and sedation. (5.3.7) respiratory depression and sedation. (5.3, 7)

respiratory depression and sedation. (5.3, 1) Prolonged use of hydromorphone hydrochloride extended-release tablets during pregnancy can result in neonatal opioid withdrawal syndrome, which may be life-threatening if not recognized and treated. If opioid use is required for a prolonged period in a pregnant woman, advise the patient of the risk of neonatal opioid withdrawal syndrome and ensure that appropriate treatment will be available. (5.4) To ensure that the benefits of opioid analgesics outweigh the risks of addiction, abuse, and misuse, the Food and Drug Administration (FDA) has required a Risk Evaluation and Mitigation Strategy (REMS)

--- RECENT MAJOR CHANGES---Dosage and Administration (2.2, 2.4) Warnings and Precautions (5.1, 5.2, 5.3, 5.6)

Overdosage (10) Patient Counseling Information

---INDICATIONS AND USAGE---Hydromorphone hydrochloride extended-release tablets are an opioid agonist indicated for the management of severe

and persistent pain that requires an extended treatment period with a daily opioid analgesic and for which alternative treatment options are inadequate Patients considered opioid tolerant are those who are taking, for one week or longer, at least 60 mg oral morphine per day. 25 mcg transdermal fentanyl per hour, 30 mg oral oxycodone per day, 8 mg oral hydromorphone per day, 25 mg oral oxymorphone per day, 60 mg oral hydrocodone per day, or an equianalgesic dose of another opioid.

Limitations of Use Because of the risks of addiction, abuse, and misuse with opioids, which can occur at any dosage or duration, and because of the greater risks of overdose and death with extended-release/long-acting opioid formulations,

- reserve hydromorphone hydrochloride extended-release tablets for use in patients for whom alternative treatment options (e.g., non-opioid analgesics or immediate-release opioids) are ineffective, not tolerated, or would be otherwise inadequate to provide sufficient management of pain. (1)

 Hydromorphone hydrochloride extended-release tablets are not indicated as an as-needed (prn) analgesic. (1)
- -----DOSAGE AND ADMINISTRATION---Hydromorphone hydrochloride extended-release tablets should be prescribed only by healthcare professionals who
- are knowledgeable about the use of extended-release/long-acting opioids and how to mitigate the associated risks. (2.1) For once daily administration IN OPIOID-TOLERANT PATIENTS. (2.1)
- Use the lowest effective dosage for the shortest duration of time consistent with individual patient treatment goals. Reserve titration to higher doses of hydromorphone hydrochloride extended-release tablets for patients in whom lower doses are insufficiently effective and in whom the expected benefits of using a higher dose opioid clearly outweigh the substantial risks. (2.1, 5)
- Initiate the dosing regimen for each patient individually, taking into account the patient's underlying cause and severity of pain, prior analgesic treatment and response, and risk factors for addiction, abuse, and misuse (5.1)
- Respiratory depression can occur at any time during opioid therapy, especially when initiating and following dosage increases with hydromorphone hydrochloride extended-release tablets. Consider this risk when selecting

an initial dose and when making dose adjustments (2.1, 5.2)

- Instruct patients to swallow hydromorphone hydrochloride extended-release tablets intact, and not to cut, break, chew, crush, or dissolve the tablets (risk of potentially fatal overdose). (2.1, 5.1) Discuss availability of naloxone with the patient and caregiver and assess each patient's need for access to
- naloxone, both when initiating and renewing treatment with hydromorphone hydrochloride extended-release tablets. Consider prescribing naloxone based on the patient's risk factors for overdose. [2.2, 5.1, 5.2, 5.3]. Dose may be increased using increments of 4 to 8 mg every 3 to 4 days as needed to achieve adequate analgesia. (2.4)
- Do not abruptly discontinue hydromorphone hydrochloride extended-release tablets in a physically-dependent
 patient because rapid discontinuation of opioid analgesics has resulted in serious withdrawal symptoms,
 uncontrolled pain, and suicide. (2.5, 5.13)
- Moderate Hepatic Impairment: Initiate treatment with 25% of the dose that would be prescribed for patients with normal hepatic function. Monitor closely for respiratory and central nervous system depression. (2.6) Moderate and Severe Renal Impairment: Initiate treatment in patients with moderate renal impairment with 50% and patients with severe renal impairment with 25% of the hydromorphone hydrochloride extended-release tablets dose that would be prescribed for patients with normal renal function. Monitor closely for respiratory and central

FULL PRESCRIBING INFORMATION

WARNING: SERIOUS AND LIFE-THREATENING RISKS FROM USE OF HYDROMORPHONE HYDROCHLORIDE FYTENDED-RELEASE TABLETS

Addiction, Abuse, and Misuse Because the use of hydromorphone hydrochloride extended-release tablets exposes patients and other users to the risks of opioid addiction, abuse, and misuse, which can lead to overdose and death, assess each patient's risk prior to prescribing and reassess all patients regularly for the development of these ehaviors and conditions [see Warnings and Precautions (5.1)].

Life-Threatening Respiratory Depression Serious, life-threatening, or fatal respiratory depression may occur with use of hydromorphone hydrochloride extended-release tablets, especially during initiation or following a dosage increase. To reduce the risk of respiratory depression, proper dosing and titration of hydromorphone hydrochloride

Accidental Ingestion Accidental ingestion of even one dose of hydromorphone hydrochloride extended-release tablets especially by children, can result in a fatal overdose of hydromorphone [see Warnings and Precautions

Risks From Concomitant Use With Benzodiazepines Or Other CNS Depressants Concomitant use of opioids with benzodiazepines or other central nervous system (CNS) depressants, including alcohol, may result in profound sedation, respiratory depression, coma, and death. Reserve concomitant prescribing of hydromorphone hydrochloride extended-release tablets and benzodiazepines or other CNS depressants for use in patients for whom alternative treatment options are inadequate [see Warnings and Precautions (5.3), Drug Interactions (7)].

Neonatal Opioid Withdrawal Syndrome (NOWS) If opioid use is required for an extended period of time in a pregnant woman, advise the patient of the

risk of NOWS, which may be life-threatening if not recognized and treated. Ensure that manage neonatology experts will be available at delivery [see Warnings and Precautions (5.4)].

Opioid Analgesic Risk Evaluation and Mitigation Strategy (REMS) ealthcare providers are strongly encouraged to complete a REMS-compliant education program and to ounsel patients and caregivers on serious risks, safe use, and the importance of reading the Medication

1 INDICATIONS AND USAGE

Hydromorphone hydrochloride extended-release tablets are indicated for the management of severe and persistent pain that requires an extended treatment period with a daily opioid analgesic and for which alternative treatment Patients considered opioid tolerant are those who are receiving, for one week or longer, at least 60 mg oral morphine

per day, 25 mcg transdermal fentanyl per hour, 30 mg oral oxycodone per day, 8 mg oral hydromorphone per day, 25

ng oral oxymorphone per day, 60 mg oral hydrocodone per day, or an equianalgesic dose of another opioid Limitations of Use Because of the risks of addiction, abuse, and misuse with opinids, which can occur at any dosage or duration and because of the greater risks of overdose and death with extended-release/long-acting opioid formulations, [see Warnings and Precautions (5.1)], reserve hydromorphone hydrochloride extended-release tablets for use in

patients for whom alternative treatment options (e.g., non-opioid analgesics or immediate-release opioids) are ineffective, not tolerated, or would be otherwise inadequate to provide sufficient management of pain. Hydromorphone hydrochloride extended-release tablets are not indicated as an as-needed (prn) analogsic.

Guide with each prescription *[see Warnings and Precautions (5.5)].*

2 DOSAGE AND ADMINISTRATION 2.1 Important Dosage and Administration Instructions To avoid medication errors, prescribers and pharmacists must be aware that hydromorphone is available as both

immediate-release 8 mg tablets and extended-release 8 mg tablets. Hydromorphone hydrochloride extended-release tablets should be prescribed only by healthcare professionals who are knowledgeable about the use of extended-release/long-acting opioids and how to mitigate the associated risks. Due to the risk of respiratory depression, hydromorphone hydrochloride extended-release tablets are only indicated for use in patients who are already opioid-tolerant. Discontinue or taper all other extended-release opioids when beginning hydromorphone hydrochloride extended-release tablets therapy. As hydromorphone hydrochloride extended-release tablets therapy. release tablets are only for use in opioid-tolerant patients, do not begin any patient on hydromorphone hydrochloride extended-release tablets as the first opioid.

Patients who are opioid-tolerant are those receiving, for one week or longer, at least 60 mg of oral morphine per day, at least 25 mcg transdermal fentanyl per hour, at least 30 mg of oral oxycodone per day, at least 8 mg of oral nydromorphone per day, at least 25 mg oral oxymorphone per day, at least 60 mg oral hydrocodone per day, or an

- Use the lowest effective dosage for the shortest duration of time consistent with individual patient treatment goals [see Warnings and Precautions (5)]. Because the risk of overdose increases as opioid doses increase reserve titration to higher doses of hydromorphone hydrochloride extended-release tablets for patients in whom lower doses are insufficiently effective and in whom the expected benefits of using a higher dose opioid clearly outweigh the substantial risks.
- Initiate the dosing regimen for each patient individually, taking into account the patient's underlying cause and prior analgesic treatment and response, and risk factors for addiction, abuse, and misuse [see Warnings and Precautions (5.1)1.
- Respiratory depression can occur at any time during opioid therapy, especially when initiating and follow dosage increases with hydromorphone hydrochloride extended-release tablets. Consider this risk when selecting an initial dose and when making dose adjustments [see Warnings and Precautions (5)]. instruct patients to swallow hydromorphone hydrochloride extended-release tablets whole [see Patient Counseling

Information (17)]. Crushing, chewing, or dissolving hydromorphone hydrochloride extended-rele

n uncontrolled delivery of hydromorphone and can lead to overdose or death [see Warnings and Precautions (5.1)]. 2.2 Patient Access to Naloxone for the Emergency Treatment of Opioid Overdose Discuss the availability of naloxone for the emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing treatment with hydromorphone hydrochloride extended-release tablets [see Warnings and Precautions (5.2), Patient Counseling Information (17)]. Inform patients and caregivers about the various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (e.g., by prescription, directly from a pharmacist, or as part of

a community-based program). Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. The presence of risk factors for overdose should not prevent the proper management of pain in any given patient [see Warnings and Precautions (5.1, 5.2, 5.3)]. Consider prescribing naloxone if the patient has household members (including children) or other close contacts at risk for accidental ingestion or overdose.

2.3 Initial Dosage Conversion from Other Oral Hydromorphone Formulations to Hydromorphone Hydrochloride Extended-Release Tablets Patients receiving oral immediate-release hydromorphone may be converted to hydromorphone hydrochloride extended-release tablets by administering a starting dose equivalent to the patient's total daily oral hydromorphone dose, taken once daily.

Conversion from other oral opioids to Hydromorphone Hydrochloride Extended-Release Tablets When hydromorphone hydrochloride extended-release tablets therapy is initiated, discontinue all other opioid analgesics other than those used on an as needed basis for breakthrough pain when appropriate.

There is substantial inter-patient variability in the relative potency of different opioid drugs and opioid formulations.

Therefore, a conservative approach is advised when determining the total daily dosage of hydromorphone hydrochloride extended-release tablets. It is safer to underestimate a patient's 24-hour oral hydromorphone dosage and provide rescue medication (e.g., immediate-release opioid) than to overestimate the 24-hour oral hydromorphone dosage and manage an adverse reaction due to overdose.

In an hydromorphone hydrochloride extended-release tablets clinical trial with an open-label titration period, patients were converted from their prior opioid to hydromorphone hydrochloride extended-release tablets using the **Table 1** as a guide for the initial hydromorphone hydrochloride extended-release tablets dose. The recommended starting dose of bydromorphone bydrochloride extended-release tablets are 50% of the calculated estimate of daily bydromorphone requirement. Calculate the estimated daily hydromorphone requirement using Table 1. Consider the following when using the information in **Table 1**: This is **not** a table of equianalgesic doses.

• The conversion factors in this table are only for the conversion from one of the listed oral opioid analgesics to

hydromorphone hydrochloride extended-release tablets.

The table **cannot** be used to convert **from** hydromorphone hydrochloride extended-release tablets to another

opioid. Doing so will result in an overestimation of the dose of the new opioid and may result in fatal overdose. Conversion Factors to Hydromorphone Hydrochloride Extended-Release Tablets

| Prior Oral Opioid | Approximate Oral Conversion Factor |
|-------------------|------------------------------------|
| Hydromorphone | 1 |
| | |

- Codeine 0.06 Hydrocodone 0.4 Methadone 0.6 Morphine 0.2 **Oxycodone** 0.4 0.6
- For patients on a single opioid, sum the current total daily dose of the opioid and then multiply the total daily dose by the conversion factor to calculate the approximate oral hydromorphone daily dose. For patients on a regimen of more than one opioid, calculate the approximate oral hydromorphone dose for each

To calculate the estimated hydromorphone hydrochloride extended-release tablets dose using **Table 1**

opioid and sum the totals to obtain the approximate total hydromorphone daily dose these products in the conversion

Always round the dose down, if necessary, to the appropriate hydromorphone hydrochloride extended-release tablets strength(s) available Example conversion from a single opioid to hydromorphone hydrochloride extended-release tablets

- Step 1: Sum the total daily dose of the opioid • 30 mg of oxycodone 2 times daily = 60 mg total daily dose of oxycodone
- Step 2: Calculate the approximate equivalent dose of oral hydromorphone based on the total daily dose of the current opioid using Table 1 60 mg total daily dose of oxycodone x Conversion Factor of 0.4 = 24 mg of oral hydromorphone daily Step 3: Calculate the approximate starting dose of hydromorphone hydrochloride extended-release tablets to be given
 - every 24 hours, which is 50% of the calculated oral hydromorphone dose. Round down, if necessary, to the appropriate hydromorphone hydrochloride extended-release tablet strengths available. 50% of 24 mg results in an initial dose of 12 mg of hydromorphone hydrochloride extended-release

· Adjust individually for each patient Close observation and frequent titration are warranted until pain management is stable on the new opioid. Monitor patients for signs and symptoms of opioid withdrawal or for signs of over-sedation/toxicity after converting patients to hydromorphone hydrochloride extended-release tablets.

Conversion from Transdermal Fentanyl to hydromorphone hydrochloride extended-release tablets Fighteen hours following the removal of the transdermal fentanyl patch, bydromorphone bydrochloride extended-Eignteen hours forward en leinovar of the datiseering a lentanyly pater, hydromorphone hydrochloride extended-release tablets treatment can be initiated. To calculate the 24-hour hydromorphone hydrochloride extended-release tablets dose, use a conversion factor of 25 mcg/hr fentanyl transdermal patch to 12 mg of hydromorphone ydrochloride extended-release tablets. Then reduce the hydromorphone hydrochloride extended-release tablets dose by 50%.

Step 1: Identify the dose of transdermal fentanyl.

 75 mg of transdermal fentanyl Step 2: Use the conversion factor of 25 mcg/hr fentanyl transdermal patch to 12 mg of hydromorphone hydrochloride

 75 mg of transdermal fentanyl: 36 mg total daily dose of hydromorphone hydrochloride extended-release Step 3: Calculate the approximate starting dose of hydromorphone hydrochloride extended-release tablets to be given every 24 hours, which is 50% of the converted dose. Round down, if necessary, to the appropriate

hydromorphone hydrochloride extended-release tablet strengths available. 50% of 36 mg results in an initial dose of 18 mg, which would be rounded down to 16 mg of hydromorphone hydrochloride extended-release tablets once daily

 Adjust individually for each patient Conversion from Methadone to Hydromorphone Hydrochloride Extended-Release Tablets Close monitoring is of particular importance when converting from methadone to other opioid agonists. The ratio

has a long half-life and can accumulate in the plasma 2.4 Titration and Maintenance of Therapy Individually titrate hydromorphone hydrochloride extended-release tablets to a dose that provides adequate analgesia and minimizes adverse reactions. Continually reevaluate patients receiving hydromorphone hydrochloride extended release tablets to assess the maintenance of pain control, signs and symptoms of opioid withdrawal, and other adverse reactions, as well as to reassess for the development of addiction, abuse, or misuse *[see Warnings and Precautions (5.1, 5.13)]*. Frequent communication is important among the prescriber, other members of the healthcare team, the patient, and the caregiver/family during periods of changing analgesic requirements, including initial titration. During use of opioid therapy for an extended period of time, periodically reassess the continued need

between methadone and other opioid agonists may vary widely as a function of previous dose exposure. Methadone

for use of opioid analgesics.

Plasma levels of hydromorphone hydrochloride extended-release tablets are sustained for 18 to 24 hours. Dosage djustments of hydromorphone hydrochloride extended-release tablets may be made in increments of 4 to 8 mg every 3 to 4 days as needed to achieve adequate analgesia.

Patients who experience breakthrough pain may require a dose increase of hydromorphone hydrochloride extendedrelease tablets, or may need rescue medication with an appropriate dose of an immediate-release analgesic. If the evel of pain increases after dose stabilization, attempt to identify the source of increased pain before increasing the morphone hydrochloride extended-release tablets dose.

If after increasing the dosage, unacceptable opioid-related adverse reactions are observed (including an increase in

pain after dosage increase), consider reducing the dosage [see Warnings and Precautions (5)]. Adjust the dosage to obtain an appropriate balance between management of pain and opioid-related adverse reactions. 2.5 Safe Reduction or Discontinuation of Hydromorphone Hydrochloride Extended-Release Tablets Do not abruptly discontinue hydromorphone hydrochloride extended-release tablets in patients who may be physically

dependent on opioids. Rapid discontinuation of opioid analgesics in patients who are physically dependent on opioids has resulted in serious withdrawal symptoms, uncontrolled pain, and suicide. Rapid discontinuation has also been associated with attempts to find other sources of opioid analgesics, which may be confused with drug-seeking for abuse. Patients may also attempt to treat their pain or withdrawal symptoms with illicit opioids, such as heroin, and other substances. When a decision has been made to decrease the dose or discontinue therapy in an opioid-dependent patient takin lydromorphone hydrochloride extended-release tablets, there are a variety of factors that should be considered including the total daily dose of opioid (including hydromorphone hydrochloride extended-release tablets) the patient has been taking, the duration of treatment, the type of pain being treated, and the physical and psychological attributes of the patient. It is important to ensure ongoing care of the patient and to agree on an appropriate tapering schedule and follow-up plan so that patient and provider goals and expectations are clear and realistic. When opioid

such as medication assisted treatment of opioid use disorder. Complex patients with comorbid pain and substruse disorders may benefit from referral to a specialist. There are no standard opioid tapering schedules that are suitable for all patients. Good clinical practice dictates a patient-specific plan to taper the dose of the opioid gradually. For patients on hydromorphone hydrochloride extended-release tablets who are physically opioid-dependent, initiate the taper by a small enough increment (e.g., no greater than 10% to 25% of the total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2 to 4 weeks. Patients who have been taking opioids for briefer periods of time may tolerate a more

inalgesics are being discontinued due to a suspected substance use disorder, evaluate and treat the patient, or refer

for evaluation and treatment of the substance use disorder. Treatment should include evidence-based approaches

It may be necessary to provide the patient with lower dosage strengths to accomplish a successful taper. Reassess the patient frequently to manage pain and withdrawal symptoms, should they emerge. Common withdrawal symptoms include restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, and mydriasis. Other signs and symptoms also may develop, including irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate. If withdrawal symptoms arise, it may be necessary to pause the taper for a period of time or raise the dose of the opioid analgesic to the previous dose, and then proceed with a slower taper. In addition, evaluate patients for any changes in mood, emergence of suicidal thoughts, or use of other substances.

When managing patients taking opioid analgesics, particularly those who have been treated for an extended period of time, and/or with high doses for chronic pain, ensure that a multimodal approach to pain management, including mental health support (if needed), is in place prior to initiating an opioid analgesic taper. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the esic [see Warnings and Precautions (5.13), Drug Abuse and Dependence (9.3)]. 2.6 Dosage Modifications in Patients with Moderate Hepatic Impairment Start patients with moderate hepatic impairment on 25% of the hydromorphone hydrochloride extended-release tablets dose that would be prescribed for patients with normal hepatic function. Closely monitor patients with

moderate hepatic impairment for respiratory and central nervous system depression during initiation of therapy with hydromorphone hydrochloride extended-release tablets and during dose titration. Use of alternate analgesics i mended for patients with severe hepatic impairment [see Use in Specific Populations (8.6)]. 2.7 Dosage Modifications in Patients with Renal Impairment Start patients with moderate renal impairment on 50% of the hydromorphone hydrochloride extended-release tablets mechanism of OIH is not fully understood, multiple biochemical pathways have been implicated. Medical literature suggests a strong biologic plausibility between opioid analgesics and OIH and allodynia. If a patient is suspected to be experiencing OIH, carefully consider appropriately decreasing the dose of the current opioid analgesic or opioid rotation (safely switching the patient to a different opioid moiety) [see Dosage and Administration (2.5); Warnings and 5.7 Life-Threatening Respiratory Depression in Patients with Chronic Pulmonary Disease or in Elderly,

Cachectic, or Debilitated Patients The use of hydromorphone hydrochloride extended-release tablets in patients with acute or severe bronchial asthma

in an unmonitored setting or in the absence of resuscitative equipment is contraindicated. Patients with Chronic Pulmonary Disease: Hydromorphone hydrochloride extended-release tablets treated patients with significant chronic obstructive pulmonary disease or cor pulmonale, and those with a substantially decreased respiratory reserve, hypoxia, hypercapnia, or pre-existing respiratory depression are at increased risk of decreased respiratory drive including apnea, even at recommended dosages of hydromorphone hydrochloride extended-rel tablets [see Warnings and Precautions (5.2)].

cachectic, or debilitated patients because they may have altered pharmacokinetics or altered clearance con younger, healthier patients [see Warnings and Precautions (5.2)]. Regularly evaluate patients, particularly when initiating and titrating hydromorphone hydrochloride extended-release tablets and when hydromorphone hydrochloride extended-release tablets are given concomitantly with other drugs that depress respiration [see Warnings and Precautions (5), Drug Interactions (7)]. Alternatively, consider the use o

Elderly, Cachectic, or Debilitated Patients: Life-threatening respiratory depression is more likely to occur in elderly.

5.8 Adrenal Insufficiency Cases of adrenal insufficiency have been reported with opioid use, more often following greater than one month of use. Presentation of adrenal insufficiency may include non-specific symptoms and signs including nausea, vomiting, anorexia, fatigue, weakness, dizziness, and low blood pressure. If adrenal insufficiency is suspected, confirm the diagnosis with diagnostic testing as soon as possible. If adrenal insufficiency is diagnosed, treat with physiologic replacement doses of corticosteroids. Wean the patient off of the opioid to allow adrenal function to recover and continue corticosteroid treatment until adrenal function recovers. Other opioids may be tried as some cases reported use of a different opioid without recurrence of adrenal insufficiency. The information available does not identify any particular opioids as being more likely to be associated with adrenal insufficiency.

Hydromorphone hydrochloride extended-release tablets may cause severe hypotension including orthostatic hypotension and syncope in ambulatory patients. There is an increased risk in patients whose ability to maintain blood pressure has already been compromised by a reduced blood volume, or concurrent administration of certain CNS depressant drugs (e.g., phenothiazines or general anesthetics) [see Drug Interactions (7)]. Regularly evaluate these patients for signs of hypotension after initiating or titrating the dosage of hydromorphone hydrochloride extendedrelease tablets. In patients with circulatory shock, hydromorphone hydrochloride extended-release tablets may cause vasodilation that can further reduce cardiac output and blood pressure. Avoid the use of hydromorphone hydrochloride extended-release tablets in patients with circulatory shock.

5.10 Risks of Use in Patients with Increased Intracranial Pressure, Brain Tumors, Head Injury, or Impaired In patients who may be susceptible to the intracranial effects of CO, retention (e.g., those with evidence of increased intracranial pressure or brain tumors), hydromorphone hydrochloride extended-release tablets may reduce respiratory drive, and the resultant CO₂ retention can further increase intracranial pressure. Monitor such patients for signs of sedation and respiratory depression, particularly when initiating therapy with hydromorphone hydrochloride extended-

release tablets. Opioids may also obscure the clinical course in a patient with a head injury. Avoid the use of hydromorph hydrochloride extended-release tablets in patients with impaired consciousness or coma. 5.11 Risks of Use in Patients with Gastrointestinal Conditions

Hydromorphone hydrochloride extended-release tablets are contraindicated in patients with known or suspected gastrointestinal obstruction, including paralytic ileus. Avoid the use of hydromorphone hydrochloride extended-release tablets in patients with other GI obstruction. Because the hydromorphone hydrochloride extended-release tablet is nondeformable and does not appreciably change in shape in the GI tract, hydromorphone hydrochloride extended-release tablets are contraindicated in

patients with preexisting severe gastrointestinal narrowing (pathologic or latrogenic, for example: esophageal motility disorders, small bowel inflammatory disease, "short gut" syndrome due to adhesions or decreased transit time, past history of peritonitis, cystic fibrosis, chronic intestinal pseudoobstruction, or Meckel's diverticulum). There have been reports of obstructive symptoms in patients with known strictures or risk of strictures, such as previous GI surgery, in ssociation with the ingestion of drugs in nondeformable extended-release formulations It is possible that hydromorphone hydrochloride extended-release tablets may be visible on abdominal x-rays under certain circumstances, especially when digital enhancing techniques are utilized.

The hydromorphone in hydromorphone hydrochloride extended-release tablets may cause spasm of the sphincter of

Oddi. Opioids may cause increases in serum amylase. Regularly evaluate patients with biliary tract disease, including

dose that would be prescribed for patients with normal renal function. Closely monitor patients with renal impairment for respiratory and central nervous system depression during initiation of therapy with hydromorphone hydrochloride extended-release tablets and during dose titration. As hydromorphone hydrochloride extended-release tablets are only acute pancreatitis, for worsening symptoms

5.12 Increased Risk of Seizures in Patients with Seizure Disorders The hydromorphone in hydromorphone hydrochloride extended-release tablets may increase the frequency of seizures in patients with seizure disorders, and may increase the risk of seizures occurring in other clinical settings associated with seizures. Regularly evaluate patients with a history of seizure disorders for worsened seizure control during hydromorphone hydrochloride extended-release tablets therapy.

Do not abruptly discontinue hydromorphone hydrochloride extended-release tablets in a natient physically dependent bot not aduptly discontinue injunction in your extensive extensive release tables in a patient physically dependent patient, gradually taper the dosage. Rapid tapering of hydromorphone in a patient physically dependent on opioids

may lead to a withdrawal syndrome and return of pain [see Dosage and Administration (2.5), Drug Abuse and Additionally, avoid the use of mixed agonist/antagonist (e.g., pentazocine, nalbuphine, and butorphanol) or partial agonist (e.g., buprenorphine) analgesics in patients who are receiving a full opioid agonist analgesic, including hydromorphone hydrochloride extended-release tablets. In these patients, mixed agonist/antagonist and partial agonist analgesics may reduce the analgesic effect and/or may precipitate withdrawal symptoms [see Drug Interactions (7)].

lydromorphone hydrochloride extended-release tablet contains sodium metabisulfite, a sulfite that may cause allergictype reactions including anaphylactic symptoms and life-threatening or less severe asthmatic episodes in certain susceptible people. The overall prevalence of sulfite sensitivity in the general population is unknown and probably low. Sulfite sensitivity is seen more frequently in asthmatic than in nonasthmatic people [see Adverse Reactions (6.2)].

5.15 Risks of Driving and Operating Machinery hydromorphone hydrochloride extended-release tablets may impair the mental and/or physical abilities needed to perform potentially hazardous activities such as driving a car or operating machinery. Warn patients not to drive or operate dangerous machinery unless they are tolerant to the effects of hydromorphone hydrochloride extendedease tablets and know how they will react to the medication [see Patient Counseling Information (17)].

The following serious adverse reactions are discussed elsewhere in the labeling:

Addiction, Abuse, and Misuse [see Warnings and Precautions (5.1)]

Life-Threatening Respiratory Depression [see Warnings and Precautions (5.2)] Neonatal Opioid Withdrawal Syndrome [see Warnings and Precautions (5.4)] interactions with Benzodiazepine or Other CNS Depressants [see Warnings and Precautions (5.3)]

Opioid-Induced Hyperalgesia and Allodynia [See Warnings and Precautions (5.6)] Adrenal Insufficiency [see Warnings and Precautions (5.8)]

Severe Hypotension [see Warnings and Precautions (5.9)] Gastrointestinal Adverse Reactions [see Warnings and Precautions (5.11)]

 Seizures [see Warnings and Precautions (5.12)] Withdrawal [see Warnings and Precautions (5.13)] 6.1 Clinical Trial Experience

trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rate observed in clinical practice. Hydromorphone hydrochloride extended-release tablets was administered to a total of 2.524 patients in 15 controlled and uncontrolled clinical studies. Of these, 423 patients were exposed to hydromorphone hydrochloride extended-release tablets for greater than 6 months and 141 exposed for greater than one year.

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical

The most common adverse reactions leading to study discontinuation were nausea, vomiting, constipation, somnolence, and dizziness. The most common treatment-related serious adverse reactions from controlled and uncontrolled chronic pain studies were drug withdrawal syndrome, overdose, confusional state, and constipation. The overall incidence of adverse reactions in patients greater than 65 years of age was higher, with a greater than The obtain include of adverse reactions in patients greater than 5 years or age was ingret, with a greater than 5% difference in rates for constipation and nausea when compared with younger patients. The overall incidence of adverse reactions in female patients was higher, with a greater than 5% difference in rates for nausea, vomiting,

constipation and somnolence when compared with male patients. A 12-week double-blind, placebo-controlled, randomized withdrawal study was conducted in opioid tolerant patients with moderate to severe low back pain [see Clinical Studies (14)]. A total of 447 patients were enrolled into the openlabel titration phase with 268 patients randomized into the double-blind treatment phase. The adverse reactions that were reported in at least 2% of the patients are contained in Table 2.

The following Adverse Reactions occurred in patients with an overall frequency of < 2% and are listed in descending order within each System Organ Class:

* Reflux esonhagitis, gastroesonhageal reflux disease and Rarrett's esonhagus were grouped and reported with dyspensia

change, feeling jittery, hangover, gait disturbance, feeling drunk, body temperature decreased

Cardiac disorders: palpitations, tachycardia, bradycardia, extrasystole Ear and labyrinth disorders: vertigo, tinnitus

Endocrine disorders: hypogonadism Eve disorders: vision blurred, diplopia, dry eve, miosis

Infections and infestations: gastroenteritis, diverticulitis

Injury, poisoning and procedural complications: contusion, overdose

Gastrointestinal disorders: flatulence, dysphagia, hematochezia, abdominal distension, hemorrhoids, abnormal feces, intestinal obstruction, eructation, diverticulum, gastrointestinal motility disorder, large intestine perforation, anal fissure, bezoar, duodenitis, ileus, impaired gastric emptying, painful defecation General disorders and administration site conditions: chills, malaise, feeling abnormal, feeling of body temperature

 $\underline{\text{Investigations}} : weight \ decreased, \ hepatic \ enzyme \ increased, \ blood \ potassium \ decreased, \ blood \ amylase \ increased, \ property \ and \$ blood testosterone decreased Metabolism and nutrition disorders: dehydration, fluid retention, increased appetite, hyperuricemia Musculoskeletal and connective tissue disorders: myalgia

dysarthria, syncope, balance disorder, dysgeusia, depressed level of consciousness, coordination abnormal, hyperesthesia, myoclonus, dyskinesia, crying, hyperreflexia, encephalopathy, cognitive disorder, convulsion, psychomotor hyperactivity

<u>Psychiatric disorders</u>: confusional state, nervousness, restlessness, abnormal dreams, mood altered, hallucination, panic attack, euphoric mood, paranoia, dysphoria, listless, suicide ideation, libido decreased, aggression

Nervous system disorders: tremor, sedation, hypoesthesia, paresthesia, disturbance in attention, memory impairment

Renal and urinary disorders: dysuria, urinary retention, urinary frequency, urinary hesitation, micturition disorder Reproductive system and breast disorders: erectile dysfunction, sexual dysfunction Respiratory, thoracic and mediastinal disorders: rhinorrhea, respiratory distress, hypoxia, bronchospasm, sneezing, hyperventilation, respiratory depression

extended-release tablets [see Contraindications (4) and Warnings and Precautions (5.14)]

profound sedation, coma, and death.

Skin and subcutaneous tissue disorders: erythema Vascular disorders: flushing, hypertension, hypotension 3.2 Postmarketing Experience

The following adverse reactions have been identified during post approval use of hydromorphone. Because these

Impact:

reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure. <u>Serotonin syndrome</u>: Cases of serotonin syndrome, a potentially life-threatening condition, have been reported during concomitant use of opioids with serotonergic drugs [see Drug Interactions (7)]. Adrenal insufficiency: Cases of adrenal insufficiency have been reported with opioid use, more often following greater than one month of use *[see Warnings and Precautions (5.8)]*.

Anaphylaxis: Anaphylactic reaction has been reported with ingredients contained in hydromorphone hydrochloride

Androgen deficiency: Cases of androgen deficiency have occurred with use of opioids for an extended period of time [see Clinical Pharmacology (12.2)]. Hyperalgesia and Allodynia: Cases of hyperalgesia and allodynia have been reported with opioid therapy of any duration [see Warnings and Precautions (5.6)].

<u>Hypoglycemia:</u> Cases of hypoglycemia have been reported in patients taking opioids. Most reports were in patients with at least one predisposing risk factor (e.g., diabetes). 7 DRUG INTERACTIONS

 Table 4 includes clinically significant drug interactions with hydromorphone hydrochloride extended-release tablets.
 Table 4.

Clinically Significant Drug Interactions with Hydromorphone Hydrochloride Extended-Release Tablets Benzodiazepines and Other Central Nervous System (CNS) Depressants Due to additive pharmacologic effect, the concomitant use of benzodiazepines or other CNS

depressants, including alcohol, can increase the risk of hypotension, respiratory depression,

Reserve concomitant prescribing of these drugs for use in patients for whom alternative treatment options are inadequate. Limit dosages and durations to the minimum required. Inform patients and caregivers of this potential interaction, educate them on the signs and symptoms of espiratory depression (including sedation). If concomitant use is warranted, consider prescribing naloxone for the emergency treatment of opioid overdose. Benzodiazepines and other sedatives/hypnotics, anxiolytics, tranquilizers, muscle relaxants Examples:

general anesthetics, antipsychotics, other opioids, alcohol. Serotonergic Drugs Clinical The concomitant use of opioids with other drugs that affect the serotonergic neurotransmitte system has resulted in serotonin syndrome. If concomitant use is warranted, frequently evaluate the patient, particularly during treatmen

initiation and dose adjustment. Discontinue hydromorphone hydrochloride extended-release tablet

1/17/24 3:47 PM

immediately if serotonin syndrome is suspected. Selective serotonin reuptake inhibitors (SSRIs), serotonin and norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), triptans, 5-HT3 receptor antagonists, drugs that affect the serotonin neurotransmitter system (e.g., mirtazapine, trazodone, tramadol), certain muscle axants (i.e., cyclobenzaprine, metaxalone), monoamine oxidase (MAO) inhibitors (those intended to treat psychiatric disorders and also others, such as linezolid and intravenous methylene blue).

Monoamine Oxidase Inhibitors (MAOIs) MAOI interactions with opioids may manifest as serotonin syndrome or opioid toxicity (e.g., Clinical respiratory depression, coma) [see Warnings and Precautions (5.3)].

12120 PIL HYDROMORPHONE HYDROCHLORIDE EXTENDED-RELEASE TABLETS (Ascent-Camber).indd 1

| Intervention: | The use of hydromorphone hydrochloride extended-release tablets are not recommended for patients taking MAOIs or within 14 days of stopping such treatment. | | | | |
|---------------------|---|--|--|--|--|
| Examples: | phenelzine, tranylcypromine, linezolid | | | | |
| Mixed Agonis | t/Antagonist and Partial Agonist Opioid Analgesics | | | | |
| Clinical Impact: | May reduce the analgesic effect of hydromorphone hydrochloride extended-release tablets and/or precipitate withdrawal symptoms [see Warnings and Precautions (5.13)]. | | | | |
| Intervention: | Avoid concomitant use. | | | | |
| Examples: | butorphanol, nalbuphine, pentazocine, buprenorphine | | | | |
| Muscle Relax | ants | | | | |
| Clinical Impact: | Hydromorphone may enhance the neuromuscular blocking action of skeletal muscle relaxants and produce an increased degree of respiratory depression [see Warnings and Precautions (5.3)]. | | | | |
| Intervention: | Because respiratory depression may be greater than otherwise expected, decrease the dosage of hydromorphone hydrochloride extended-release tablets and/or the muscle relaxant as necessary. Due to the risk of respiratory depression with concomitant use of muscle relaxants and opioids, consider prescribing naloxone for the emergency treatment of opioid overdose. | | | | |
| Diuretics | | | | | |
| Clinical Impact: | Opioids can reduce the efficacy of diuretics by inducing the release of antidiuretic hormone. | | | | |
| Intervention: | Evaluate patients for signs for diminished diuresis and/or effects on blood pressure and increase the dosage of the diuretic as needed. | | | | |
| Anticholinerg | c Drugs | | | | |
| Clinical Impact: | The concomitant use of anticholinergic drugs may increase risk of urinary retention and/or severe constipation, which may lead to paralytic ileus. | | | | |
| Intervention: | Evaluate patients for signs of urinary retention or reduced gastric motility when hydromorphone hydrochloride extended-release tablets are used concomitantly with anticholinergic drugs. | | | | |

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy Risk Summary

Use of opioid analgesics for an extended period of time during pregnancy may cause neonatal opioid withdrawal syndrome [see Warnings and Precautions (5.4)]. There are no adequate and well-controlled studies in pregnant women. Based on animal data, advise pregnant women of the potential risk to a fetus.

In animal reproduction studies, reduced postnatal survival of pups, developmental delays, and altered behavioral

responses were noted following oral treatment of pregnant rats with hydromorphone during gestation and through lactation at doses 2.1 times the human daily dose of 32 mg/day (HDD), respectively. In published studies, neural tube defects were noted following subcutaneous injection of hydromorphone to pregnant hamsters at doses 4.8 times the HDD and soft tissue and skeletal abnormalities were noted following subcutaneous continuous infusion of 2.3 times the HDD to pregnant mice. No malformations were noted at 2.1 or 17 times the HDD in pregnant rats or rabbits, respectively [see Data]. Based on animal data, advise pregnant women of the potential risk to a fetus.

The estimated background risk of major birth defects and miscarriage for the indicated population is unknown. All

pregnancies have a background risk of birth defect loss or other adverse outcomes. In the U.S. general population the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2 to 4% Clinical Considerations

Fetal/Neonatal Adverse Reactions

Use of opioid analgesics for an extended period of time during pregnancy for medical or nonmedical purposes can result in physical dependence in the neonate and neonatal opioid withdrawal syndrome shortly after birth. Neonatal opioid withdrawal syndrome presents as irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and failure to gain weight. The onset, duration, and severity of neonatal opioid withdrawal syndrome vary based on the specific opioid used, duration of use, timing and amount of last maternal use, and rate syndrome vary observed in the specime opinior discussion of designation of the drug by the newborn. Observe newborns for symptoms of neonatal opioid withdrawal syndrome, and manage accordingly [see Warnings and Precautions (5.4)].

Labor or Delivery Opioids cross the placenta and may produce respiratory depression and psycho-physiologic effects in neonates. An opioid antagonist, such as naloxone, must be available for reversal of opioid-induced respiratory depression in the neonate. Hydromorphone hydrochloride extended-release tablets are not recommended for use in pregnant women during or immediately prior to labor, when use of shorter-acting analgesics or other analgesic techniques are more appropriate. Opioid analgesics, including hydromorphone hydrochloride extended-release tablets can prolong labor through actions which temporarily reduce the strength, duration, and frequency of uterine contractions. However, this effect is not consistent and may be offset by an increased rate of cervical dilation, which tends to shorten labor. Monitor neonates exposed to opioid analgesics during labor for signs of excess sedation and respiratory depression. Data

Pregnant rats were treated with hydromorphone hydrochloride from Gestation Day 6 to 17 via oral gayage doses of 1.75, 3.5, or 7 mg/kg/day (0.5, 1.1, or 2.1 times the HDD of 32 mg/day based on body surface area, respectively). Maternal toxicity was noted in all treatment groups (reduced food consumption and body weights in the two highest dose groups). There was no evidence of malformations or embryotoxicity reported.

Pregnant rabbits were treated with hydromorphone hydrochloride from Gestation Day 6 to 20 via oral gavage doses of 10, 25, or 50 mg/kg/day (4.3, 8.5, or 17 times the HDD of 32 mg/day based on body surface area, respectively). Maternal toxicity was noted in the highest dose group (reduced food consumption and body weights). There was no

evidence of malformations or embryotoxicity reported. In a published study, neural tube defects (exencephaly and cranioschisis) were noted following subcutaneous administration of hydromorphone hydrochloride (19 to 258 mg/kg) on Gestation Day 8 to pregnant hamsters (4.8 to 65.4 times the HDD of 32 mg/day based on body surface area). The findings cannot be clearly attributed to maternal toxicity. No neural tube defects were noted at 14 mg/kg (3.5 times the human daily dose of 3 mg/day). In a published study, CF-1 mice were treated subcutaneously with continuous infusion of 7.5, 15, or 30 mg/kg/day hydromorphone hydrochloride (1.1, 2.3, or 4.6 times the human daily dose of 32 mg based on body surface area) via implanted osmotic pumps during organogenesis (Gestation Days 7 to 10). Soft tissue malformations (cryptorchidism, cleft palate, malformed ventricles and retina), and skeletal variations (split supraccipital, checkerboard and split sternebrae, delayed ossification of the paws and ectopic ossification sites) were observed at doses 2.3 times the human dose of 32 mg/day based on body surface area. The findings cannot be clearly attributed to maternal toxicity.

Pregnant rats were treated with hydromorphone hydrochloride from Gestation Day 6 to Lactation Day 21 via oral gavage doses of 1.75, 3.5, or 7 mg/kg/day (0.5, 1.1, or 2.1 times the HDD of 32 mg/day based on body surface area, respectively). Reduced pup weights were noted at 1.1 and 2.1 times the human daily dose of 32 mg/day and increased pup deaths, delayed ear opening, reduced auditory startle reflex, and reduced open-field activity were also noted at 2.1 times the HDD. Maternal toxicity was noted in all treatment groups (reduced food consumption and body weights in all groups) and decreased maternal care in the high dose group.

8.2 Lactation Risk Summary

Because of the potential for serious adverse reactions, including excess sedation and respiratory depression in a breastfed infant, advise patients that breastfeeding is not recommended during treatment with hydromorphone hydrochloride extended-release tablets. Low concentrations of hydromorphone have been detected in human milk in clinical trials. Withdrawal symptoms can occur in breastfeeding infants when maternal administration of an opioid analgesic is stopped. Nursing should not be undertaken while a patient is receiving hydromorphone hydrochloride extended-release tablets since hydromorphone is excreted in the milk. Clinical Considerations

Monitor infants exposed to hydromorphone hydrochloride extended-release tablets through breast milk for excess sedation and respiratory depression. Withdrawal symptoms can occur in breastfed infants when maternal administration of an opioid analgesic is stopped, or when breast-feeding is stopped.

8.3 Females and Males of Reproductive Potential

Use of opioids for an extended period of time may cause reduced fertility in females and males of reproductive potential. It is not known whether these effects on fertility are reversible [see Adverse Reactions (6.2), Nonclinical Toxicology (13.1)]

8.4 Pediatric Use of hydromorphone hydrochloride extended-release tablets in patients 17 years of age and

younger have not been established 8.5 Geriatric Use

Elderly patients (aged 65 years or older) may have increased sensitivity to hydromorphone. In general, use caution when selecting a dosage for an elderly patient, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function and of concomitant disease or other drug therapy.

Respiratory depression is the chief risk for elderly patients treated with opioids and has occurred after large initial doses were administered to patients who were not opioid-tolerant or when opioids were co-administered with other agents that depress respiration. Titrate the dosage of hydromorphone hydrochloride extended-release tablets slowly in geriatric patients and frequently reevaluate the patient for signs of central nervous system and respiratory depression [see Warnings and Precautions (5.2)].

lydromorphone is known to be substantially excreted by the kidney, and the risk of adverse reactions to this drug may be greater in patients with impaired renal function. Because elderly patients are more likely to have decreased renal function, care should be taken in dose selection, and it may be useful to regularly evaluate renal function.

In a study that used a single 4 mg oral dose of immediate-release hydromorphone tablets, four-fold increases in plasma levels of hydromorphone (C_{max} and $AUC_{\text{p.-o.}}$) were observed in patients with moderate hepatic impairment (Child-Pugh Group B). Start patients with moderate hepatic impairment on 25% of the hydromorphone hydrochloride extended-release tablets dose that would be used in patients with normal hepatic function. Closely monitor patients with moderate hepatic impairment for respiratory and central nervous system depression during initiation of therapy with hydromorphone hydrochloride extended-release tablets and during dose titration. The pharmacokinetics of hydromorphone in severe hepatic impairment patients have not been studied. As further increases in C_{max} and AUC. of hydromorphone in this group are expected, use of alternate analgesics is recommended *[see Dosage and*] stration (2.6)1

Administration of a single 4 mg dose of immediate-release hydromorphone tablets resulted in two-fold and four-fold increases in plasma levels of hydromorphone (C_{\max} and AUC_{0-48}) in moderate (CLcr = 40 to 60 mL/min) and severe (CLcr < 30 mL/min) impairment, respectively. In addition, in patients with severe renal impairment hydromorphone appeared to be more slowly eliminated with longer terminal elimination half-life. Start patients with moderate renal impairment on 50% and patients with severe renal impairment on 25% of the hydromorphone hydrochloride extended-release tablets dose that would be prescribed for patients with normal renal function. Closely monitor patients with renal impairment for respiratory and central nervous system depression during initiation of therapy with hydromorphone hydrochloride extended-release tablets and during dose titration. As hydromorphone hydrochloride extended-release tablets are only intended for once daily administration, consider use of an alternate analgesic at may permit more flexibility with the dosing interval in patients with severe renal impairment [see Dosage and

9 DRUG ABUSE AND DEPENDENCE 9.1 Controlled Substance

ydromorphone hydrochloride extended-release tablets contains hydromorphone, a Schedule II controlled substance 9.2 Abuse

Hydromorphone hydrochloride extended-release tablets contains hydromorphone, a substance with high potential for misuse and abuse, which can lead to the development of substance use disorder, including addiction [see Warnings

and Precautions (5.1)]. Misuse is the intentional use, for therapeutic purposes, of a drug by an individual in a way other than prescribed by a healthcare provider or for whom it was not prescribed.

Abuse is the intentional, non-the rapeutic use of a drug, even once, for its desirable psychological or physiological effects.Drug addiction is a cluster of behavioral, cognitive, and physiological phenomena that may include a strong desire to take the drug, difficulties in controlling drug use (e.g., continuing drug use despite harmful consequences, giving a higher priority to drug use than other activities and obligations), and possible tolerance or physical dependence. Misuse and abuse of hydromorphone hydrochloride extended-release tablets increases risk of overdose, which may lead to central nervous system and respiratory depression, hypotension, seizures, and death. The risk is increased with concurrent abuse of hydromorphone hydrochloride extended-release tablets with alcohol and other CNS depressants. Abuse of and addiction to opioids in some individuals may not be accompanied by concurrent tolerance and symptoms of physical dependence. In addition, abuse of opioids can occur in the absence of addiction. All patients treated with opioids require careful and frequent reevaluation for signs of misuse, abuse, and addiction, because use of opioid analgesic products carries the risk of addiction even under appropriate medical use. Patients at

high risk of hydromorphone hydrochloride extended-release tablets abuse include those with a history of prolonged use of any opioid, including products containing hydromorphone, those with a history of drug or alcohol abuse, or those who use hydromorphone hydrochloride extended-release tablets in combination with other abused drugs. "Drug-seeking" behavior is very common in persons with substance use disorders. Drug-seeking tactics include nergency calls or visits near the end of office hours, refusal to undergo appropriate examination, testing, or referral, peated "loss" of prescriptions, tampering with prescriptions, and reluctance to provide prior medical records or contact information for other treating healthcare provider(s). "Doctor shopping" (visiting multiple prescribers to obtain additional prescriptions) is common among people who abuse drugs and people with substance use disorder. Preoccupation with achieving adequate pain relief can be appropriate behavior in a patient with inadequate pain control. Hydromorphone hydrochloride extended-release tablets, like other opioids, can be diverted for nonmedical use into

illicit channels of distribution. Careful record-keeping of prescribing information, including quantity, frequency, and enewal requests, as required by state and federal law, is strongly advised.

Proper assessment of the patient, proper prescribing practices, periodic reevaluation of therapy, and proper dispensing and storage are appropriate measures that help to limit abuse of opioid drugs. Risks Specific to Abuse of Hydromorphone Hydrochloride Extended-Release Tablets

Abuse of hydromorphone hydrochloride extended-release tablets poses a risk of overdose and death. The risk is increased with concurrent use of hydromorphone hydrochloride extended-release tablets with alcohol and/or other

Hydromorphone hydrochloride extended-release tablets is approved for oral use only. Inappropriate intravenous, intramuscular, or subcutaneous use of hydromorphone hydrochloride extended-release tablets can result in death, local tissue necrosis, infection, pulmonary granulomas, increased risk of endocarditis, and valvular heart injury, and embolism. Parenteral drug abuse is commonly associated with transmission of infectious diseases such as hepatitis and HIV.

Both tolerance and physical dependence can develop during use of opioid therapy. Tolerance is a physiological state characterized by a reduced response to a drug after repeated administration (i.e., a higher dose of a drug is required to produce the same effect that was once obtained at a lower dose). Physical dependence is a state that develops as a result of a physiological adaptation in response to repeated drug use, manifested by withdrawal signs and symptoms after abrupt discontinuation or a significant dose reduction of a drug. Withdrawal may be precipitated through the administration of drugs with opioid antagonist activity (e.g., naloxone) mixed agonist/antagonist analgesics (e.g., pentazocine, butorphanol, nalbuphine), or partial agonists (e.g., buprenorphine). Physical dependence may not occur to a clinically significant degree until after several days to weeks

Do not abruptly discontinue hydromorphone hydrochloride extended-release tablets in a patient physically dependent on opioids. Rapid tapering of hydromorphone hydrochloride extended-release tablets in a patient physically dependent on opioids may lead to serious withdrawal symptoms, uncontrolled pain, and suicide. Rapid discontinuation has also been associated with attempts to find other sources of opioid analgesics, which may be confused with drug-seeking

When discontinuing hydromorphone hydrochloride extended-release tablets, gradually taper the dosage using a patient-specific plan that considers the following: the dose of hydromorphone hydrochloride extended-release tablets the patient has been taking, the duration of treatment, and the physical and psychological attributes of the patient. To improve the likelihood of a successful taper and minimize withdrawal symptoms, it is important that the opioid tapering schedule is agreed upon by the patient. In patients taking opioids for an extended period of time at high doses, ensure that a multimodal approach to pain management, including mental health support (if needed), is in place prior to initiating an opioid analgesic taper [see Dosage and Administration (2.5), and Warnings and Precautions (5.13)]. Infants born to mothers physically dependent on opioids will also be physically dependent and may exhibit respiratory difficulties and withdrawal signs [see Use in Specific Populations (8.1)].

10 OVERDOSAGE

Clinical Presentation

Acute overdose with hydromorphone hydrochloride extended-release tablets can be manifested by respiratory depression, somnolence progressing to stupor or coma, skeletal muscle flaccidity, cold and clammy skin, constricted

pupils, and, in some cases pulmonary edema, bradycardia, hypotension, hypoglycemia, partial or complete airway obstruction, atypical snoring, and death. Marked mydriasis rather than miosis may be seen with hypoxia in overdose situations.

In case of overdose, priorities are the reestablishment of a patent and protected airway and institution of assisted or controlled ventilation, if needed. Employ other supportive measures (including oxygen and vasopressors) in the management of circulatory shock and pulmonary edema as indicated. Cardiac arrest or arrhythmias will require advanced life-support measures.

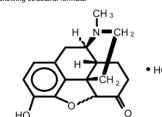

Opioid antagonists, such as naloxone, are specific antidotes to respiratory depression resulting from opioid overdose. For clinically significant respiratory or circulatory depression secondary to opioid overdose, administer an opioid

antagonist. Because the duration of reversal is expected to be less than the duration of action of hydromorphone in hydromorphone hydrochloride extended-release tablets, carefully monitor the patient until spontaneous respiration is reliably reestablished. Hydromorphone hydrochloride extended-release tablets will continue to release hydromorphone and add to the hydromorphone load for up to 24 to 48 hours or longer following ingestion, necessitating prolonged monitoring. If the response to opioid antagonist is suboptimal or only brief in nature, administer additional antagonist as directed by the product's prescribing information.

In an individual physically dependent on opioids, administration of the recommended usual dosage of the antagonist will precipitate an acute withdrawal syndrome. The severity of the withdrawal symptoms experienced will depend on the degree of physical dependence and the dose of the antagonist administered. If a decision is made to treat serious respiratory depression in the physically dependent patient, administration of the antagonist should be initiated with care and by titration with smaller than usual doses of the antagonist

Hydromorphone hydrochloride extended-release tablets are for oral use and contain hydromorphone hydrochloride,

Hydromorphone hydrochloride USP is 4.5α-epoxy-3-hydroxy-17-methylmorphinan-6-one hydrochloride. Hydromorphone hydrochloride is a white or almost white crystalline powder that is freely soluble in water, very slightly soluble in ethanol (96%), and practically insoluble in methylene chloride. Its empirical formula is C₁₇H₁₈NO₃•HCl. The compound has the following structural formula:

Hydromorphone hydrochloride extended-release tablets also contains the following inactive ingredients: Polyethylene Oxide, Povidone, butylated hydroxytoluene, Isogropyl Alcohol, Magnesium Stearate, Sodium Chloride, Hydroxypropyl Methyl Cellulose, Ferric Oxide Yellow, Acetone, Cellulose acetate, Polyethylene glycol, hypromellose and titanium

The 8 mg, 12 mg and 16 mg also contains iron oxide yellow and polysorbate. The 32 mg also contains talc, black iron oxide and propylene glycol 12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

lydromorphone, a semi-synthetic morphine derivative, is a hydrogenated ketone of morphine Hydromorphone is a full opioid agonist and is relatively selective for the mu-opioid recentor, although it can bind to other opioid receptors at higher doses. The principal therapeutic action of hydromorphone is analgesia. Like all full opioid agonists, there is no ceiling effect for analgesia with morphine. Clinically, dosage is titrated to provide adequate analgesia and may be limited by adverse reactions, including respiratory and CNS depression.

The precise mechanism of the analgesic action is unknown. However, specific CNS opioid receptors for endogenous compounds with opioid-like activity have been identified throughout the brain and spinal cord and are thought to play a role in the analgesic effects of this drug.

CNS Depressant/Alcohol Interaction Additive pharmacodynamic effects may be expected when hydromorphone hydrochloride extended-release tablets are used in conjunction with alcohol, other opioids, legal or illicit drugs that cause central nervous system depression. Effects on the Central Nervous System

Hydromorphone produces dose-related respiratory depression by direct action on brain stem respiratory centers. The respiratory depression involves a reduction in the responsiveness of the brain stem respiratory centers to both increases in carbon dioxide tension and to electrical stimulation. Hydromorphone causes miosis, even in total darkness. Pinpoint pupils are a sign of opioid overdose but are not

pathognomic (e.g., pontine lesions of hemorrhagic or ischemic origins may produce similar findings). Marked mydriasis, rather than miosis, may be seen due to severe hypoxia in overdose situations. Effects on the Gastrointestinal Tract and Other Smooth Muscle lydromorphone causes a reduction in motility associated with an increase in tone in the antrum of the stomach and duodenum. Digestion of food in the small intestine is delayed and propulsive contractions are decreased. Propulsive

peristaltic waves in the colon are decreased, while tone is increased to the point of spasm, resulting in constipation, Other opioid-induced effects may include a reduction in biliary and pancreatic secretions, spasm of sphincter of Oddi, Effects on the Cardiovascular System Hydromorphone produces peripheral vasodilation which may result in orthostatic hypotension or syncope. Release

of histamine may be induced by hydromorphone and can contribute to opioid-induced hypotension. Manifestations of histamine release or peripheral vasodilation may include pruritus, flushing, red eyes, sweating and/or orthostatio Effects on the Endocrine System

Opioids inhibit the secretion of ACTH, cortisol, and luteinizing hormone (LH) in humans. They also stimulate prolactin, growth hormone (GH) secretion, and pancreatic secretion of insulin and glucagon. Use of opioids for an extended period of time may influence the hypothalamic-pituitary-gonadal axis, leading to androgen deficiency that may manifest as low libido, impotence, erectile dysfunction, amenorrhea, or infertility. The causal role of opioids in the clinical syndrome of hypogonadism is unknown because the various medical, physical, lifestyle, and psychological stressors that may influence gonadal hormone levels have not been adequately controlled for in studies conducted to date [see Adverse Reactions (6.2)].

Effects on the Immune System Opioids have been shown to have a variety of effects on components of the immune system in *in vitro* and animal models. The clinical significance of these findings is unknown. Overall, the effects of opioids appear to be modestly mmunosunnressive

Concentration-Efficacy Relationships The minimum effective analgesic concentration will vary widely among patients, especially among patients who have been previously treated with opioid agonists. The minimum effective analgesic concentration of hydromorphone for any individual patient may increase over time due to an increase in pain, the development of a new pain syndrome, and/or the development of analgesic tolerance [see Dosage and Administration (2.1), (2.4)]. Concentration-Adverse Reaction Relationships

There is a relationship between increasing hydromorphone plasma concentration and increasing frequency of doserelated opioid adverse reactions such as pausea, vomiting, CNS effects, and respiratory depression. In opioid-tolerant patients, the situation may be altered by the development of tolerance to opioid-related adverse reactions [see Dosage and Administration (2.1), (2.3), (2.4)].

12.3 Pharmacokinetics

bsorption Hydromorphone hydrochloride extended-release tablets are an extended-release formulation of hydromorphone hydromorphone hydrochloride extended release tables are all extended release to influence that produces a gradual increase in hydromorphone concentrations. Following a single-dose administration of hydromorphone hydrochloride extended-release tablets, plasma concentrations gradually increase over 6 to 8 hours, and thereafter concentrations are sustained for approximately 18 to 24 hours post-dose. The median T..., values ranged from 12 to 16 hours. The mean half-life was approximately 11 hours, ranging from 8 to 15 hours in most individual subjects. Linear pharmacokinetics has been demonstrated for hydromorphone hydrochloride extendedrelease tablets over the dose range 8 to 64 mg, with a dose-proportional increase in $C_{\scriptscriptstyle max}$ and overall exposure (AUC.) (see Table 5). Steady-state plasma concentrations are approximately twice those observed following the first dose, and steady state is reached after 3 to 4 days of once-daily dosing of hydromorphone hydrochloride extended-release tablets. At steady state, hydromorphone hydrochloride extended-release tablets given once daily maintained hydromorphone plasma concentrations within the same concentration range as the immediate-release tablet given 4 times daily at the same total daily dose and diminished the fluctuations between peak and trough concentrations seen with the immediate-release tablet (see **Figure 1**). The bioavailability of hydromorphone hydrochloride extended-release tablets once daily and immediate-release hydromorphone four times daily in adults is comparable, as presented in **Table 5**.

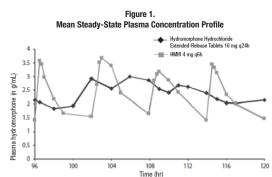

Table 5. Mean (±SD) Hydromorphone Hydrochloride Extended-Rel

| Dosage | T _{max} * (hrs) | C _{max} (ng/mL) | AUC (ng·hr/mL) | T _{1/2} (hr) |

* Median (range) reported for T_{max} † Steady-state results on Day 5 (0-24 hours)

Food Effect

Excretion

The pharmacokinetics of hydromorphone hydrochloride extended-release tablets are not affected by food as indicated by bioequivalence when administered under fed and fasting conditions. Therefore, hydromorphone hydrochloride extended-release tablets may be administered without regard to meals. When a 16 mg dose of hydromorphone hydrochloride extended-release tablets was administered to healthy volunteers immediately following a high-fat meal, the median time to C_{max} (T_{max}) was minimally affected by the high-fat meal occurring at 16 hours compared to 18

Distribution following intravenous administration of hydromorphone to healthy volunteers, the mean volume of distribution was 2.9 (±1.3) L/kg, suggesting extensive tissue distribution. The mean extent of binding of hydromorphone to human

plasma proteins was determined to be 27% in an in vitro study Elimination

After oral administration of an immediate-release formulation, hydromorphone undergoes extensive first-pass metabolism and is metabolized primarily in the liver by glucuronidation to hydromorphone-3-glucuronide, which follows a similar time course to hydromorphone in plasma. Exposure to the glucuronide metabolite is 35 to 40 times higher than exposure to the parent drug. *In vitro* data suggest that hydromorphone in clinically relevant concentrations has minimal potential to inhibit the activity of human hepatic CYP450 enzymes including CYP1A2, 2C9, 2C19, 2D6, 3A4, and 4A11.

Approximately 75% of the administered dose is excreted in urine. Most of the administered hydromorphone dose is bolites. Approximately 7% and 1% of the dose are excreted as unchanged hydromorphone in urine and feces, respectively.

Age: Geriatric Patients Population PK analysis performed on plasma concentration data from 407 osteoarthritis (OA) patients using hydromorphone hydrochloride extended-release tablets showed an average 11% increase in hydromorphone AUC in the elderly group (65 to 75 years of age) when compared to the younger age group (less than or equal to 65 years

Females appeared to have approximately 10% higher mean systemic exposure in terms of $\mathbf{C}_{\text{\tiny max}}$ and AUC values. Hepatic Impairment

In a study that used a single 4 mg oral dose of immediate-release hydromorphone tablets, four-fold increases in plasma levels of hydromorphone (C_{max} and AUC_{0-m}) were observed in patients with moderate hepatic impairment (Child-Pugh Group B). Pharmacokinetics of hydromorphone in severe hepatic impairment patients has not been studied. Further increase in C_{max} and AUC_{q...} of hydromorphone in this group is expected. Start patients with moderate hepatic impairment on 25% of the usual dose of hydromorphone hydrochloride extended-release tablets and closely monitor for respiratory and central nervous system depression during dose titration. Consider alternate analgesic therapy for patients with severe hepatic impairment [see Dosage and Administration (2.6) and Specific Populations (8.6)].

Renal impairment affected the pharmacokinetics of hydromorphone and its metabolites following administration of a single 4 mg dose of immediate-release tablets. The effects of renal impairment on hydromorphone pharmacokinetics were two-fold and four-fold increases in plasma levels of hydromorphone (C_{max} and AUC_{0-480}) in moderate (CLcr = 40 to 60 mL/min) and severe (CLcr < 30 mL/min) impairment, respectively. In addition, in patients with severe renal impairment hydromorphone appeared to be more slowly eliminated with longer terminal elimination half-life (40 hr) compared to subjects with normal renal function (15 hr). Start patients with moderate renal impairment on 140 in) compared to subjects with normal relat function (15 in). Start patients with motivate relat in high minute of 50% of the usual hydromorphone hydrochloride extended-release tablets dose for patients with normal renal function and closely monitor for respiratory and central nervous system depression during dose titration. As hydromorphone hydrochloride extended-release tablets are only intended for once-daily administration, consider use of an alternate analgesic that may permit more flexibility with the dosing interval in patients with severe renal impairment [see Dosage and Administration (2.7) and Use in Specific Populations (8.7)].

Drug Interaction Studies An in vivo study examined the effect of alcohol (40%, 20%, 4% and 0%) on the bioavailability of a single dose of 16 mg of hydromorphone hydrochloride extended-release tablets in healthy, fasted or fed volunteers. The results shower that the hydromorphone mean $AUC_{0-\omega}$ was 5% higher and 4% lower (not statistically significant) in the fasted and fed groups respectively after co-administration of 240 mL of 40% alcohol. The AUC₀₋₋₋ was similarly unaffected in

subjects following the co-administration of hydromorphone hydrochloride extended-release tablets and alcohol (240

The change in geometric mean C_{max} with concomitant administration of alcohol and hydromorphone hydrochloride The change in geometric mean v_{max} with concomitant administration of alcohol and hydromorpone hydrocinone extended-release tablest ranged from an increase of 10% to 31% across all conditions studied. The change in mean C_{max} was greater in the fasted group of subjects. Following concomitant administration of 240 mL of 40% alcohol while fasting, the mean C_{max} increased by 37% and up to 151% in an individual subject. Following the concomitant administration of 240 mL of 20% alcohol while fasting, the mean C_{max} increased by 35% and up to 139% in an individual subject. Following the concomitant administration of 240 mL of 4% alcohol while fasting, the mean C_{max} increased by 19% on average and as much as 73% for an individual subject. The range of median T_{max} for the fed and fasted freatments with 4% 20% and 40% alcohol was 12 to 16 hours compared in 16 hours for the 0% alcohol and fasted treatments with 4%, 20% and 40% alcohol was 12 to 16 hours compared to 16 hours for the 0% alcohol

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis Long-term studies to evaluate the carcinogenic potential of hydromorphone hydrochloride were completed in both Han-Wistar rats and Crl:CD1®(ICR) mice. Hydromorphone HCl was administered to Han-Wistar rats (2, 5, and 15 mg/kg/day for males, and 8, 25 and 75 mg/kg/day for females) for 2 years by oral gavage. In female rats, incidences of hibernoma (tumor of brown fat) were increased at 10.5 times the maximum recommended daily exposure based on AUC at the mild dose (2 tumor, 25 mg/kg/day) and 53.7 times the maximum recommended human daily exposure based on AUC at the maximum dose (4 tumors, 75 mg/kg/day). The clinical relevance of this finding to humans has not been established. There was no evidence of carcinogenicity in male rats. The systemic drug exposure (AUC, ng-h/mL) at the 15 mg/kg/day in male rats was 7.6 times greater than the human exposure at a single dose of 32 mg/ml. day of hydromorphone hydrochloride extended-release tablets. There was no evidence of carcinogenic potential in Crt:CD1®(ICR) mice administered hydromorphone HCl at doses up to 15 mg/kg/day for 2 years by oral gavage. The systemic drug exposure (AUC, ng•h/mL) at the 15 mg/kg/day in mice was 1.1 (in males) and 1.2 (in females) times greater than the human exposure at a single dose of 32 mg/day of hydromorphone hydrochloride extended-release

Mutagenesis

Hydromorphone was not mutagenic in the *in vitro* bacterial reverse mutation assay (Ames assay). Hydromorphone was not clastogenic in either the *in vitro* human lymphocyte chromosome aberration assay or the *in vivo* mouse micronucleus assay. Impairment of Fertility

Reduced implantation sites and viable fetuses were noted at 2.1 times the human daily dose of 32 mg/day in a study in which female rats were treated orally with 1.75, 3.5, or 7 mg/kg/day hydromorphone hydrochloride (0.7, 1.4, or 2.8 times a human daily dose of 24 mg/day (HDD) based on body surface area) beginning 14 days prior to mating through Gestation Day 7 and male rats were treated with the same hydromorphone hydrochloride doses beginning 28 days prior to and throughout mating.

Hydromorphone hydrochloride extended-release tablets was investigated in a double-blind, placebo-controlled randomized withdrawal study in opioid tolerant patients with moderate-to-severe low back pain. Patients were considered opioid tolerant if they were currently on opioid therapy that was ≥ 60 mg/day of oral morphine equivalen for at least 2 months prior to screening. Patients entered an open-label conversion and titration phase with orphone hydrochloride extended-release tablets, were converted to a starting dose that was approximatel rigutionity in the hydrochioride extended-release tablets, were converted to a starting dose that was approximately 75% of their total daily morphine equivalent dose, and were dosed once daily until adequate pain control was achieved while exhibiting tolerable side effects. Supplemental immediate-release hydromorphone tablets were allowed throughout the study. Patients who achieved a stable dose entered a 12-week, double-blind, placebocontrolled, randomized treatment phase. Mean daily dose at randomization was 37.8 mg/day (range of 12 mg/day to 64 mg/day). Fifty-eight (58) percent of patients were successfully titrated to a stable dose of hydromorphone hydrochloride extended-release tablets during the open-label conversion and titration phase.

During the double-blind treatment phase, patients randomized to hydromorphone hydrochloride extended-release tablets continued with the stable dose achieved in the conversion and titration phase of the study. Patients randomized to placebo received, in a blinded manner, hydromorphone hydrochloride extended-release tablets and matching placebo in doses tapering from the stable dose achieved in conversion and titration. During the taper down period, patients were allowed immediate-release hydromorphone tablets as supplemental analgesia to minimize opioid withdrawal symptoms in placebo patients. After the taper period, the number of immediate-release hydromorphone tablets was limited to two tablets per day. Forty-nine (49) percent of patients treated with hydromorphone hydrochloride extendedrelease tablets and 33% of patients treated with placebo completed the 12-week treatment period.

Hydromorphone hydrochloride extended-release tablets provided superior analgesia compared to placebo. There was a significant difference between the mean changes from Baseline to Week 12 or Final Visit in average weekly pain intensity Numeric Bating Scale (NRS) scores obtained from patient diaries between the two groups. The proportion of patients with various degrees of improvement from screening to Week 12 or Final Visit is shown in **Figure 2**. Fo this analysis, patients who discontinued treatment for any reason prior to Week 12 were assigned a value of zero

improvement. Percent Reduction in Average Pain Intensity from Screening to Week 12 or Final Visit — Hydromorphone Hydrochloride Extended-Release Tablets Week 12 - HMIR Week 12

16 HOW SUPPLIED/STORAGE AND HANDLING

Iromorphone Hydrochloride Extended-Release Tablet Strengths The 8 mg tablets are Light pink to pink film coated, round, biconvex tablets printed with "266" in black ink on one side of the tablet NDC 31722-119-01 bottles of 100 tablets

The 12 mg tablets are Light yellow to yellow film coated, round, biconvex tablets printed with "267" in black ink on

NDC 31722-120-01 bottles of 100 tablets The 16 mg tablets are Light beige to beige film coated, round, biconvex tablets printed with "268" in black ink on one side of the tablet

NDC 31722-121-01 bottles of 100 tablets The 32 mg tablets are White to off white film coated, round, biconvex tablets printed with "269" with black ink on

one side of the tablet NDC 31722-122-01 bottles of 100 tablets Store at 20° to 25°C (68° to 77°F). [See USP Controlled Room Temperature].

Store hydromorphone hydrochloride extended-release tablets securely and dispose of properly [see Patient Counseling 17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Medication Guide). Storage and Disposal

Because of the risks associated with accidental ingestion, misuse, and abuse, advise patients to store hydromorphone hydrochloride extended-release tablets securely, out of sight and reach of children, and in a location not accessible by others, including visitors to the home. Inform patients that leaving hydromorphone hydrochloride extended-release tablets unsecured can pose a deadly risk to others in the home [see Warnings and Precautions (5.1, 5.5), Drug Abuse and Dependence (9.2)1.

Expired unwanted or unused hydromorphone hydrochloride extended-release tablets should be disposed of by Expired, divided by discounting with the toilet if a drug take-back option is not readily available. Inform patients that they can visit www.fda.gov/drugdisposal for a complete list of medicines recommended for disposal by flushing, as well as additional information on disposal of unused medicines. Addiction, Abuse, and Misuse

Advise patients and caregivers that when medicines are no longer needed, they should be disposed of promptly

Inform patients that the use of hydromorphone hydrochloride extended-release tablets, even when taken as recommended, can result in addiction, abuse, and misuse, which can lead to overdose or death *[see Warnings and Precautions (5.1)]*. Instruct patients not to share hydromorphone hydrochloride extended-release tablets with others and to take steps to protect hydromorphone hydrochloride extended-release tablets from theft or misuse. <u>Life-Threatening Respiratory Depression</u>

Inform patients of the risk of life-threatening respiratory depression, including information that the risk is greatest when starting hydromorphone hydrochloride extended-release tablets or when the dose is increased, and that it can occur even at recommended dosages. Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling

911 or getting emergency medical help right away in the event of a known or suspected overdose [see Warnings and Precautions (5.2)]. Accidental Ingestion Inform patients that accidental ingestion, especially by children, may result in respiratory depression or death [see

Warnings and Precautions (5.2)]. Interactions with Benzodiazepines and Other CNS Depressants
Inform patients and caregivers that potentially fatal additive effects may occur if hydromorphone hydrochloride extended-release tablets are used with benzodiazepines or other CNS depressants, including alcohol, and not to

use these concomitantly unless supervised by a health care provider [see Warnings and Precautions (5.3), Drug Patient Access to Naloxone for the Emergency Treatment of Opioid Overdose
Discuss with the patient and caregiver the availability of naloxone for the emergency treatment of opioid overdose,
both when initiating and renewing treatment with hydromorphone hydrochloride extended-release tablets. Inform

patients and caregivers about the various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (e.g., by prescription, directly from a pharmacist, or as part of a community-based program) [see Dosage and Administration ((2.2), Warnings and Precautions (5.2)]. Educate patients and caregivers on how to recognize the signs and symptoms of an overdose. Explain to patients and caregivers that naloxone's effects are temporary, and that they must call 911 or get emergency medical help right away in all cases of known or suspected opioid overdose, even if naloxone is administered [see

If naloxone is prescribed, also advise patients and caregivers:

 How to treat with naloxone in the event of an opioid overdose . To tell family and friends about their naloxone and to keep it in a place where family and friends can access it in an emergency

 To read the Patient Information (or other educational material) that will come with their naloxone. Emphasize the importance of doing this before an opioid emergency happens, so the patient and caregiver will know what to do. Hyperalgesia and Allodynia Inform patients and caregivers not to increase opioid dosage without first consulting a clinician. Advise patients to seek medical attention if they experience symptoms of hyperalgesia, including worsening pain, increased sensitivity to pain, or new pain [see Warnings and Precautions (5.6); Adverse Reactions (6.2)].

Serotonin Syndrome inform patients that hydromorphone hydrochloride extended-release tablets could cause a rare but potentially lifethreatening condition resulting from concomitant administration of serotonergic drugs. Warn patients of the symptoms of serotonin syndrome and to seek medical attention right away if symptoms develop. Instruct patients to inform their healthcare providers if they are taking, or plan to take serotonergic medications [see Drug Interactions (7)].

MAOI Interaction Inform patients to avoid taking hydromorphone hydrochloride extended-release tablets while using any drugs that inhibit monoamine oxidase. Patients should not start MAOIs while taking hydromorphone hydrochloride extendedrelease tablets [see Drug Interactions (7)].

Important Administration Instructions Instruct patients how to properly take hydromorphone hydrochloride extended-release tablets, including the following: Hydromorphone hydrochloride extended-release tablets are designed to work properly only if swallowed intact. Taking cut, broken, chewed, crushed, or dissolved hydromorphone hydrochloride extended-release tablets can result in a fatal overdose *[see Dosage and Administration (2.1)].* Using hydromorphone hydrochloride extended-release tablets exactly as prescribed to reduce the risk of life-

threatening adverse reactions (e.g., respiratory depression) Important Discontinuation Instructions In order to avoid developing withdrawal symptoms, instruct patients not to discontinue hydromorphone hydrochloride extended-release tablets without first discussing a tapering plan with the prescriber [see Dosage and Administration (2.5)].

Driving or Operating Heavy Machinery Inform patients that hydromorphone hydrochloride extended-release tablets may impair the ability to perform potentially hazardous activities such as driving a car or operating heavy machinery. Advise patients not to perform such tasks until they know how they will react to the medication [see Warnings and Precautions (5.15)].

Advise patients of the potential for severe constipation, including management instructions and when to seek medical

attention [see Adverse Reactions (6.1), Clinical Pharmacology (12.2)]. Adrenal Insufficiency Inform patients that hydromorphone hydrochloride extended-release tablets could cause adrenal insufficiency, a potentially life-threatening condition. Adrenal insufficiency may present with non-specific symptoms and signs such as nausea, yomiting, anorexia, fatigue, weakness, dizziness, and low blood pressure. Advise patients to seek medical attention if they experience a constellation of these symptoms [see Warnings and Precautions (5.8)]

Advise patients that people with certain stomach or intestinal problems such as narrowing of the intestines or previous surgery may be at higher risk of developing a blockage. Symptoms include abdominal distension, abdominal pain, severe constipation, or vomiting. Instruct patients to contact their healthcare provider immediately if they develop these symptoms. Inform patients that hydromorphone hydrochloride extended-release tablets may cause orthostatic hypotension and

syncope. Instruct patients how to recognize symptoms of low blood pressure and how to reduce the risk of serious consequences should hypotension occur (e.g., sit or lie down, carefully rise from a sitting or lying position). Inform patients that anaphylaxis has been reported with ingredients contained in hydromorphone hydrochloride extended-release tablets. Advise patients how to recognize such a reaction and when to seek medical attention [see Contraindications (4), Warnings and Precautions (5.14), and Adverse Reactions (6.2)].

Pregnancy Neonatal Opioid Withdrawal Syndrome

Gastrointestinal Blockage

Inform female patients of reproductive potential that use of hydromorphone hydrochloride extended-release tablets for an extended period of time during pregnancy can result in neonatal opioid withdrawal syndrome, which may be ife-threatening if not recognized and treated [see Warnings and Precautions (5.4), Use in Specific Populations (8.1)] Embryo-Fetal Toxicity

cause fetal harm and to inform their healthcare provider of a known or suspected pregnancy [see Use in Specific Populations (8.1)].

Lactation

Advise patients that breastfeeding is not recommended during treatment with hydromorphone hydrochloride extended-release tablets [see Use in Specific Populations (8.2)].

Infertility Inform patients that use of opioids for an extended period of time may cause reduced fertility. It is not known whether
